# About HornetQ

What is HornetQ?

- HornetQ is an open source project to build a multi-protocol, embeddable, very high performance, clustered, asynchronous messaging system.
- For answers to more questions about what HornetQ is and what it isn't please visit the [FAQs wiki page](http://www.jboss.org/community/wiki/HornetQGeneralFAQs) [http://www.jboss.org/community/wiki/HornetQGeneralFAQs].

Why use HornetQ? Here are just a few of the reasons:

- 100% open source software. HornetQ is licenced using the Apache Software License v2.0 to minimise barriers to adoption.
- HornetQ is designed with usability in mind.
- Written in Java. Runs on any platform with a Java 6+ runtime, that's everything from Windows desktops to IBM mainframes.
- Amazing performance. Our class beating high performance journal provides persistent messaging performance at rates normally seen for non persistent messaging, our non persistent messaging performance rocks the boat too.
- Full feature set. All the features you'd expect in any serious messaging system, and others you won't find anywhere else.
- Elegant, clean-cut design with minimal third party dependencies. Run HornetQ stand-alone, run it in integrated in your favourite JEE application server, or run it embedded inside your own product. It's up to you.
- Seamless high availability. We provide a HA solution with automatic client failover so you can guarantee zero message loss or duplication in event of server failure.
- Hugely flexible clustering. Create clusters of servers that know how to load balance messages. Link geographically distributed clusters over unreliable connections to form a global network. Configure routing of messages in a highly flexible way.
- For a full list of features, please see the [features wiki page](http://www.jboss.org/community/wiki/HornetQFeatures) [http://www.jboss.org/community/wiki/HornetQFeatures] .

# Getting Started

This short guide explains how to download, install and quickly get started with HornetQ.

After downloading and installing we highly recommend you run the examples to get acquainted with HornetQ. We ship with over 70 examples demonstrating most of the features.

This guide is not intended to be a replacement for the user manual. The user manual goes into much more depth, so please consult that for further information.

# Download

The official HornetQ project page is <http://hornetq.org/>.

## 4.1. Software Download

The software can be download from the Download page: <http://hornetq.org/downloads.html>

## 4.2. Project Information

- Please take a look at our project [wiki](http://www.jboss.org/community/wiki/HornetQ) [http://www.jboss.org/community/wiki/HornetQ]
- If you have any user questions please use our [user forum](https://community.jboss.org/en/hornetq) [https://community.jboss.org/en/hornetq]
- If you have development related questions, please use our [developer forum](http://www.jboss.org/index.html?module=bb&op=viewforum&f=313) [http://www.jboss.org/index.html?module=bb&op=viewforum&f=313]
- Pop in and chat to us in our [IRC channel](irc://irc.freenode.net:6667/hornetq) [irc://irc.freenode.net:6667/hornetq]
- Our project [blog](http://hornetq.blogspot.com/) [http://hornetq.blogspot.com/]
- Follow us on [twitter](http://twitter.com/hornetq) [http://twitter.com/hornetq]
- HornetQ Git repository is <https://github.com/hornetq/hornetq>
- All release tags are available from <https://github.com/hornetq/hornetq/tags>

# Installation

This section describes how to install HornetQ.

## 5.1. Prerequisites

### Note

HornetQ only runs on Java 7 or later.

By default, HornetQ server runs with 1GiB of memory. If your computer has less memory, or you want to run it with more available RAM, modify the value in `bin/run.sh` accordingly.

For persistence, HornetQ uses its own fast journal, which you can configure to use `libaio` (which is the default when running on Linux) or Java NIO. In order to use the `libaio` module on Linux, you'll need to install `libaio`, if it's not already installed.

If you're not running on Linux then you don't need to worry about this.

You can install `libaio` using the following steps as the root user:

Using `yum`, (e.g. on Fedora or Red Hat Enterprise Linux):

```
yum install libaio
```

Using `aptitude`, (e.g. on Ubuntu or Debian system):

```
apt-get install libaio
```

## 5.2. Stand-alone HornetQ Server

After downloading the distribution, unzip it into your chosen directory. At this point it should be possible to [run straight out of the box](#), the following describes the directory structure:

```
|__ bin
|
|__ config
|   |__ jboss-as-4
|   |__ jboss-as-5
|   |__ stand-alone
```

```
|
|__ docs
|   |__ api
|   |__ quickstart-guide
|   |__ user-manual
|
|__ examples
|   |__ core
|   |__ javaee
|   |__ jms
|
|__ lib
|
|__ licenses
|
|__ schemas
```

- `bin` -- binaries and scripts needed to run HornetQ.
- `config` -- configuration files needed to configure HornetQ. This contains configurations to run HornetQ either in stand-alone or inside JBoss AS 4 and 5. Please refer to the reference guide for details on configuration.
- `docs` -- guides and javadocs for HornetQ
- `examples` -- JMS and Java EE examples. Please refer to the 'running examples' chapter for details on how to run them.
- `lib` -- jars and libraries needed to run HornetQ
- `licenses` -- licenses for HornetQ
- `schemas` -- XML Schemas used to validate HornetQ configuration files

# Starting The Server

## 6.1. Standalone HornetQ

To run a stand-alone server, open up a shell or command prompt and navigate into the `bin` directory. Then execute `./run.sh` (or `run.bat` on Windows) and you should see the following output

```
bin$ ./run.sh

15:05:54,108 INFO @main [HornetQBootstrapServer] Starting HornetQ server
...
15:06:02,566 INFO @main [HornetQServerImpl] HornetQ Server version
2.0.0.CR3 (yellowjacket, 111) started
```

HornetQ is now running.

Both the run and the stop scripts use the config under `config/stand-alone/non-clustered` by default. The configuration can be changed by running `./run.sh ../config/stand-alone/clustered` or another config of your choosing. This is the same for the stop script and the windows bat files.

## 6.2. HornetQ In Wildfly

HornetQ is the Default Messaging Provider in the *Wildfly Application Server* [<http://www.wildfly.org/>] To run the server you need to run the `standalone-full.xml` configuration by running the command `./standalone.sh -c standalone-full.xml`. You will see something like:

```
bin$ ./standalone.sh -c standalone-full.xml

=====

# Running the Examples

In the directory `examples` there are 2 sets of examples, these are

- JMS Examples - these demonstrate functionality while sending and consuming JMS messages.
- Java EE Examples - these demonstrate application server integration, e.g. MDBs, EJBs, Servlets, etc.

## 7.1. The JMS examples

The JMS Examples all follow the same format. Each examples is contained in its own directory which contains the following.

- `pom.xml`

This is the Maven build file used to run the example

- `src` directory

This contains the source code for the example

- `resources/hornetq/server0` configuration directory

This contains the configuration files needed to run the server for the example. There may be multiple configuration directories `server0`, `server1` etc for clustered examples etc.

Each example will start one or more stand-alone servers and stop them after the example has completed.

As a quick start we'll run the queue example. For all other examples refer to the main user manual.

Firstly open a Shell or a Command prompt and navigate to the `examples/jms/queue` directory.

Type the command `mvn verify` and you should see the following output:

```
[INFO] Scanning for projects...

Congratulations! You have successfully run your first HornetQ example. Try some of the others.

## 7.2. The Java EE Examples

The Java EE Examples are examples that require a JEE application server to run. They include MDB, Servlet, EJB examples etc. For this you will need the JBoss Application Server 7.1.x installed and uses Arquillian to run the example. How to do this is explained in the previous chapters.

We'll use the MDB example for the purposes of this guide. For the other examples refer to the user guide. Before going any further ensure that the JBoss Application Server is running.

The first thing we need to do is set the `JBOSS_HOME` environment property to the location of the JBoss Application Server, in a Linux shell this would be something like:

```
export JBOSS_HOME=/home/jbossas7.1/build/output/jboss-7.1.0
```

You can then run the example via maven by running `mvn test`

In the shell window you should see something like the following output:

```
[INFO] Scanning for projects...
