```

```
</web-app>  
>
```

- ① Enable and load the JSF servlet
- ② Configure requests to .jsf pages to be handled by JSF
- ③ Tell JSF that we will be giving our source files (facelets) an extension of .xhtml
- ④ Configure a session timeout of 10 minutes

##

Whilst this demo is a JSF demo, you can use Web Beans with any Servlet based web framework.

Let's take a look at the Facelet view:

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/
xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml"
  xmlns:ui="http://java.sun.com/jsf/facelets"
  xmlns:h="http://java.sun.com/jsf/html"
  xmlns:f="http://java.sun.com/jsf/core"
  xmlns:s="http://jboss.com/products/seam/taglib">

  <ui:composition template="template.xhtml">                                ①
    <ui:define name="content">
      <h1
    >Guess a number...</h1>

      <h:form id="NumberGuessMain">                                       ②
        <div style="color: red">
          <h:messages id="messages" globalOnly="false"/>
          <h:outputText id="Higher" value="Higher!" rendered="#{game.number gt game.guess
and game.guess ne 0}"/>
          <h:outputText id="Lower" value="Lower!" rendered="#{game.number lt game.guess and
game.guess ne 0}"/>
        </div>

        <div>                                                                ③
          I'm thinking of a number between #{game.smallest} and #{game.biggest}.
          You have #{game.remainingGuesses} guesses.
```

```

</div>

<div>

    Your guess:

    <h:inputText id="inputGuess"
        value="#{game.guess}"
        required="true"
        size="3"

        disabled="#{game.number eq game.guess}">

    <f:validateLongRange maximum="#{game.biggest}"
        minimum="#{game.smallest}"/>

    </h:inputText>

    <h:commandButton id="GuessButton"
        value="Guess"
        action="#{game.check}"
        disabled="#{game.number eq game.guess}"/>

</div>
<div>
    <h:commandButton id="RestartButton" value="Reset" action="#{game.reset}"
immediate="true" />
</div>
</h:form>
</ui:define>
</ui:composition>
</html>
>

```

- ① Facelets is a templating language for JSF, here we are wrapping our page in a template which defines the header.
- ② There are a number of messages which can be sent to the user, "Higher!", "Lower!" and "Correct!"
- ③ As the user guesses, the range of numbers they can guess gets smaller - this sentence changes to make sure they know what range to guess in.
- ④ This input field is bound to a Web Bean, using the value expression.
- ⑤ A range validator is used to make sure the user doesn't accidentally input a number outside of the range in which they can guess - if the validator wasn't here, the user might use up a guess on an out of range number.
- ⑥ And, of course, there must be a way for the user to send their guess to the server. Here we bind to an action method on the Web Bean.

#####

A Web Beans producer method acts as a source of objects to be injected, where:

- the objects to be injected are not required to be instances of Web Beans,
- the concrete type of the objects to be injected may vary at runtime or
- the objects require some custom initialization that is not performed by the Web Bean constructor

For example, producer methods let us:

- expose a JPA entity as a Web Bean,
- expose any JDK class as a Web Bean,
- define multiple Web Beans, with different scopes or initialization, for the same implementation class, or
- vary the implementation of an API type at runtime.

In particular, producer methods let us use runtime polymorphism with Web Beans. As we've seen, deployment types are a powerful solution to the problem of deployment-time polymorphism. But once the system is deployed, the Web Bean implementation is fixed. A producer method has no such limitation:

```
@SessionScoped
public class Preferences {

    private PaymentStrategyType paymentStrategy;

    ...

    @Produces @Preferred
    public PaymentStrategy getPaymentStrategy() {
        switch (paymentStrategy) {
            case CREDIT_CARD: return new CreditCardPaymentStrategy();
            case CHEQUE: return new ChequePaymentStrategy();
            case PAYPAL: return new PayPalPaymentStrategy();
        }
    }
}
```

```
        default: return null;
    }
}

}
```

Consider an injection point:

```
@Preferred PaymentStrategy paymentStrat;
```

This injection point has the same type and binding annotations as the producer method, so it resolves to the producer method using the usual Web Beans injection rules. The producer method will be called by the Web Bean manager to obtain an instance to service this injection point.

V. Web Beans Reference

Web Beans is the reference implementation of JSR-299, and is used by JBoss AS and Glassfish to provide JSR-299 services for Java Enterprise Edition applications. Web Beans also goes beyond the environments and APIs defined by the JSR-299 specification and provides support for a number of other environments (such as a servlet container such as Tomcat, or Java SE) and additional APIs and modules (such as logging, XSD generation for the JSR-299 XML deployment descriptors).

If you want to get started quickly using Web Beans with JBoss AS or Tomcat and experiment with one of the examples, take a look at [# 3 # ##Web Beans####](#). Otherwise read on for a exhaustive discussion of using Web Beans in all the environments and application servers it supports, as well the Web Beans extensions.

Application Servers and environments supported by Web Beans

16.1. Using Web Beans with JBoss AS

No special configuration of your application, beyond adding either `META-INF/beans.xml` or `WEB-INF/beans.xml` is needed.

If you are using JBoss AS 5.0.1.GA then you'll need to install Web Beans as an extra. First we need to tell Web Beans where JBoss is located. Edit `jboss-as/build.properties` and set the `jboss.home` property. For example:

```
jboss.home=/Applications/jboss-5.0.1.GA
```

Now we can install Web Beans:

```
$ cd webbeans-$VERSION/jboss-as
$ ant update
```

##

A new deployer, `webbeans.deployer` is added to JBoss AS. This adds supports for JSR-299 deployments to JBoss AS, and allows Web Beans to query the EJB3 container and discover which EJBs are installed in your application.

Web Beans is built into all releases of JBoss AS from 5.1 onwards.

16.2. Glassfish

TODO

16.3. Tomcat (or any plain Servlet container)

Web Beans can be used in Tomcat 6.0.

##

Web Beans doesn't support deploying session beans, injection using `@EJB`, or `@PersistenceContext` or using transactional events on Tomcat.

Web Beans should be used as a web application library in Tomcat. You should place `webbeans-tomcat.jar` in `WEB-INF/lib`. `webbeans-tomcat.jar` is an "uber-jar" provided for your convenience. Instead, you could use its component jars:

- `jsr299-api.jar`
- `webbeans-api.jar`
- `webbeans-spi.jar`
- `webbeans-core.jar`
- `webbeans-logging.jar`
- `webbeans-tomcat-int.jar`
- `javassist.jar`
- `dom4j.jar`

You also need to explicitly specify the Tomcat servlet listener (used to boot Web Beans, and control its interaction with requests) in `web.xml`:

```
<listener>
  <listener-class
>org.jboss.webbeans.environment.servlet.Listener</listener-class>
</listener>
>
```

Tomcat has a read-only JNDI, so Web Beans can't automatically bind the Manager. To bind the Manager into JNDI, you should add the following to your `META-INF/context.xml`:

```
<Resource name="app/Manager"
  auth="Container"
  type="javax.inject.manager.Manager"
  factory="org.jboss.webbeans.resources.ManagerObjectFactory"/>
```

and make it available to your deployment by adding this to `web.xml`:

```
<resource-env-ref>
  <resource-env-ref-name>
    app/Manager
  </resource-env-ref-name>
  <resource-env-ref-type>
    javax.inject.manager.Manager
  </resource-env-ref-type>
</resource-env-ref>
```

Tomcat only allows you to bind entries to `java:comp/env`, so the Manager will be available at `java:comp/env/app/Manager`

Web Beans also supports Servlet injection in Tomcat. To enable this, place the `webbeans-tomcat-support.jar` in `$TOMCAT_HOME/lib`, and add the following to your `META-INF/context.xml`:

```
<Listener className="org.jboss.webbeans.environment.tomcat.WebBeansLifecycleListener" />
```

16.4. Java SE

Apart from improved integration of the Enterprise Java stack, Web Beans also provides a state of the art typesafe, stateful dependency injection framework. This is useful in a wide range of application types, enterprise or otherwise. To facilitate this, Web Beans provides a simple means for executing in the Java Standard Edition environment independently of any Enterprise Edition features.

When executing in the SE environment the following features of Web Beans are available:

- Simple Web Beans (POJOs)
- Typesafe Dependency Injection
- Application and Dependent Contexts
- Binding Types
- Stereotypes
- Decorators
- (TODO: Interceptors ?)
- Typesafe Event Model

16.4.1. Web Beans SE Module

To make life easy for developers Web Beans provides a special module with a main method which will boot the Web Beans manager, automatically registering all simple Web Beans found on the classpath. This eliminates the need for application developers to write any bootstrapping code. The entry point for a Web Beans SE applications is a simple Web Bean which observes the standard `@Deployed` Manager event. The command line paramters can be injected using either of the following:

```
@Parameters List<String
> params;
@Parameters String[] paramsArray; // useful for compatability with existing classes
```

Here's an example of a simple Web Beans SE application:

```
@ApplicationScoped
public class HelloWorld
{
    @Parameters List<String
    > parameters;

    public void printHello( @Observes @Deployed Manager manager )
    {
        System.out.println( "Hello " + parameters.get(0) );
    }
}
```

Web Beans SE applications are started by running the following main method.

```
java org.jboss.webbeans.environments.se.StartMain <args
>
```

If you need to do any custom initialization of the Web Beans manager, for example registering custom contexts or initializing resources for your beans you can do so in response to the `@Initialized` Manager event. The following example registers a custom context:

```
public class PerformSetup
{

    public void setup( @Observes @Initialized Manager manager )
```

```
{  
    manager.addContext( ThreadContext.INSTANCE );  
}  
}
```

**##**

The command line parameters do not become available for injection until the `@Deployed` Manager event is fired. If you need access to the parameters during initialization you can do so via the public static `String getParameters()` method in `StartMain`.

JSR-299 extensions available as part of Web Beans

##

These modules are usable on any JSR-299 implementation, not just Web Beans!

17.1. Web Beans Logger

TODO

17.2. XSD Generator for JSR-299 XML deployment descriptors

 * Gets the EJB name
 *
 * @return The name
 */
public String getEjbName();
```

```
}
```

```
EjbDescriptor #####EJB#####  
BusinessInterfaceDescriptor #####EJB###jndi###
```

The resolution of `@EJB` and `@Resource` is delegated to the container. You must provide an implementation of `org.jboss.webbeans.ejb.spi.EjbServices` which provides these operations. Web Beans passes in the `javax.inject.manager.InjectionPoint` the resolution is for, as well as the `NamingContext` in use for each resolution request.

A.1.3. JPA services

Just as resolution of `@EJB` is delegated to the container, so is resolution of `@PersistenceContext`.

OPEN ISSUE: Web Beans also requires the container to provide a list of entities in the deployment, so that they aren't discovered as simple beans.

A.1.4.

```
Web Bean RI###JTA#####SPI#####(hooks)##TransactionServices #####
```

```
public interface TransactionServices  
{  
    /**  
     * Possible status conditions for a transaction. This can be used by SPI  
     * providers to keep track for which status an observer is used.  
     */  
    public static enum Status  
    {  
        ALL, SUCCESS, FAILURE  
    }  
  
    /**  
     * Registers a synchronization object with the currently executing  
     * transaction.  
     *  
     * @see javax.transaction.Synchronization  
     * @param synchronizedObserver  
     */  
    public void registerSynchronization(Synchronization synchronizedObserver);  
  
    /**  
     * Queries the status of the current execution to see if a transaction is  
     * currently active.  
     *  
     */  
}
```

```

    * @return true if a transaction is active
    */
    public boolean isTransactionActive();
}

```

```
## Status #####

#####
org.jboss.webbeans.context.api.helpers.ConcurrentHashMapBeanStore #####

```

A.1.6.

```

org.jboss.webbeans.bootstrap.api.Bootstrap #####Web Bean#####Web
Beans#####org.jboss.webbeans.bootstrap.WebBeansBootstrap #####Bootstrap#
#####SPI#####

```

The bootstrap is split into phases, bootstrap initialization and boot and shutdown. Initialization will create a manager, and add the standard (specification defined) contexts. Bootstrap will discover EJBs, classes and XML; add beans defined using annotations; add beans defined using XML; and validate all beans.

The bootstrap supports multiple environments. Different environments require different services to be present (for example servlet doesn't require transaction, EJB or JPA services). By default an EE environment is assumed, but you can adjust the environment by calling `bootstrap.setEnvironment()`.

To initialize the bootstrap you call `Bootstrap.initialize()`. Before calling `initialize()`, you must register any services required by your environment. You can do this by calling `bootstrap.getServices().add(JpaServices.class, new MyJpaServices())`. You must also provide the application context bean store.

```
##initialize()#####Bootstrap.getManager()#####
```

To boot the container you call `Bootstrap.boot()`.

```
##### Bootstrap.shutdown()#####
```

A.1.7. JNDI

Web Beans #####JNDI #####JNDI#####
org.jboss.webbeans.resources.spi.NamingContext#####

```
public interface NamingContext extends Serializable {
```

```
    /**  
     * Typed JNDI lookup  
     *  
     * @param <T  
     > The type  
     * @param name The JNDI name  
     * @param expectedType The expected type  
     * @return The object  
     */
```

```
    public <T  
    > T lookup(String name, Class<? extends T  
    > expectedType);
```

```
    /**  
     * Binds an item to JNDI  
     *

The webbeans-core.jar

If you are integrating the Web Beans into an environment that supports deployment of applications, you must insert the webbeans-core.jar into the applications isolated classloader. It cannot be loaded from a shared classloader.
